Sustainability Indicators

What is measured, will be done! So that sustainability does not remain just a nice word, parameters are necessary to define the aim and to be able to check the results.

Goals

Sustainability key data helps, alongside classical financial key data to incorporate additional factors, which are essential for social benefits and business administration success.

Sustainability key data substantiates the term "sustainability" for your organisation, makes aims comprehensible and shows advances and changes.

Performance

Together with your team, we compile made-to-measure indicators and test them by means of case scenarios. According to requirements, we develop indicator sets for individual themes, reports, or the whole organisation as well as a Sustainability Balanced Score Card.

Our experience with Environmental-, Quality-, Safety-, and Health Management Systems helps to find effective key data and to be able to firmly anchor them in every management system.

denkstatt supports the choice of indicators for the sustainability report using considerations set out in guidelines such as the Global Reporting Initiative.

The system of (sustainability) Balanced Score Card is very appropriate for comprehensive sustainable development in businesses, making this concept both understandable and measurable. The balanced Score Card - as compared to classic methods of calculation is aligned to the future.

Therefore it fits in very well with the concept of sustainable development, which on a long-term scale, has life and environmental quality as its aim.

denkstatt offers support:
